

Remote Printing SDK for Thinfinity

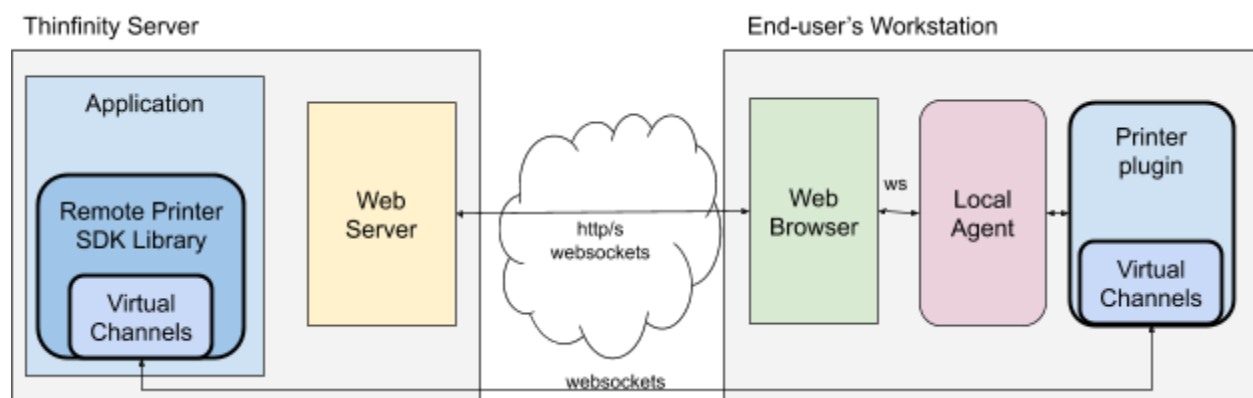

Objective

The Remote Printing SDK allows you to programmatically send commands and documents to the end-user's printer. Currently, raw printers are supported.

Components

Remote Printer SDK Library Thinfinity.RemotePrinter.dll	This module presents an COM API to be consumed by a Windows application running under Thinfinity VirtualUI or Thinfinity Remote Desktop.
Thinfinity Local Agent and Local Printer Plugin	Executable and library needed to work as a nexus between the web browser and local or network resources, otherwise inaccessible due to browser's security restrictions.
Thinfinity Virtual Channels	A proprietary Virtual Channel System used to communicate the Remote Printer SDK with the Local Printer plugin.

Basic Scheme

The Remote Printer SDK tasks:

1. Retrieve the printer list.
2. Prepare the connection for printing.
3. Send data to the printer
4. Inform the end of the printing process.
5. In case of any error must be Cancel the printing or if the user wants.
6. In case of any error, can get it more details using LastError method

API

The following table shows the methods of the Remote Printer SDK.

Methods

GetPrinters	bool GetPrinters (string Delimiter, out string Printers);		
	Retrieve all printer names detected on the end-user's side. Returns a string delimited by the Delimiter parameter.		
	Returns: True if is successful and False in case of error.		
	Parameters:		
	Name	Type	Description
	Delimiter	string	Character or string used as delimiter of the printer names on Printers param.
LastError	Printers (out)	string	Out parameter filled with the printer names delimited by Delimiter param
	void LastError (out int ErrorCode, out string ErrorMessage);		
	Retrieves the last ErrorCode and ErrorMessage. Can be used when a call to any method returns False.		
	Returns: nothing		
	Parameters		
	Name	Type	Description
	ErrorCode (out)	int	Out last error code. If ErrorCode is 0, there is not error

	ErrorMessage (out)	string	Out last error message.
BeginDoc	bool BeginDoc (int PrintType, string PrinterName, string DocName, int Encoding, out string DocID);		
	It makes the connection with the printer and initializes the print job. Creates an unique Document Id to identify a print job in subsequent calls.		
	Returns: True if the communication and actions on the selected printer was sent successful.		
	Parameters		
	Name	Type	Description
	PrintType	int	Determines the type of printing. Now support PRINT_TYPE_RAW = 1
	PrinterName	string	The name that identifies the printer.
	DocName	string	Name of the printer job to be created on the print spooler.
	Encoding	int	Identifies the format of the document to print.. PRINT_ENCODE_ANSI = 0 PRINT_ENCODE_UTF8 = 1
	DocID (out)	string	This out parameter is filled with a unique document id to be used in subsequent calls.
Print	bool Print (string DocID, string Data);		
	Sends data to the printer using the document identifier obtained using BeginDoc.. This method can be called as many times as needed to send commands or data until the entire print job is completed.		
	Returns: True if nothing went wrong.		
	Parameters		
	Name	Type	Description
	DocID	string	The document identifier obtained by

			BeginDoc
	Data	string	Data to be sent to the Printer.
EndDoc	bool EndDoc (string DocID);		
	Ends the print job. This completes the print process and sends the print job to the spooler.		
	Returns: True if the work was sent to the printer spooler.		
	Parameters		
	Name	Type	Description
	DocID	string	The document identifier obtained by BeginDoc
Abort	bool Abort (string DocID);		
	Cancels the printer job. This method must be called in case of the methods Print or EndDoc return False.		
	Parameters		
	Name	Type	Description
	DocID	string	The document identifier obtained by BeginDoc
